

During this course, I have learned many useful things about working with data. First, I learned what data is, and why it is important. I also learned the difference between objective and subjective information. Now, I understand better how to read graphs and images and how they can help in making business decisions.

We talked about the ethics and laws about using data, especially today with the rise of artificial intelligence. This made me think more about how we must use data in a fair and safe way.

One of my favorite parts was learning how to use Power BI. I created my first dashboard using Excel tables, and I made different charts. This was very interesting and new for me.

Also, I had the chance to interview a data scientist from the steel industry with my group. It was a great experience. We learned how data is used in real companies, and it helped us collect ideas and knowledge for our video project.

Another important part was understanding basic accounting. I learned how to read the income statement and balance sheet. I also practiced using vertical and horizontal analysis, and I created charts in Excel. I learned to calculate financial ratios like ROE and profit margin, and how to explain what they mean.

Because of this course, I feel more confident using data to make business decisions. I think I have achieved the learning goals. I still have more to learn, but now I have a strong base. Thank you for this course. It was useful, interesting, and practical!
